Building long term relationships with our clients
Honoring our guarantee
Proudly offering excellent after sale service
Proven 23 year track record

Frameless Experts since 1997

The Paragon Sliding Stacking glass door system is specifically designed to withstand above average windspeeds and accommodate higher openings, whilst still ensuring your unobstructed and spectacular view. This product is more robust yet still yield elegant. Each panel slides individually and stacks at a 90° angle. Based on your specific needs the doors can stack either left or right, or even both, inside or outside. The system

is proudly South African and immensely weather resistant and comes standard with the revolutionary Security Ezee Lock. Because of this locks design, we use only double lip weather strips throughout the system, ensuring an even tighter seal, giving you peace of mind on weather tightness. The Paragon Sliding Stacking Frameless Glass System has passed the AAAMSA Product Certification and SAFEIRA performance rating A1 and A2.

SIDEMOUNTED BALUSTRADES

When you need to optimize the available space, this is the most popular solution for tight fit areas such as stairs and Juliet balconies. The glass is fixed to the outside or inside face of the structure. Running vertically along and past the structure, the glass is fixed to the side face using stainless steel or aluminium brackets and fixing materials

in order to create maximum floor space. Holes are made in the glass and also includes a top handrail which is necessary to comply with the national building regulations.

Your safety should always be priority, so when selecting your Frameless Balustrade supplier, choose an installer that complies to the law.

RECESSED BALUSTRADES

For an even greater frameless look, we offer a high-quality, designer like frameless balustrade system that is reinforced beneath the surface ensuring that no fixing materials are visible. We combine sleek and sophisticated beauty allowing an uninterrupted view. A recess is made prior to finishing the floor

surface. The glass is then installed into the recess which is filled with a non-shrinking cement product. The floor then gets completed up to the glass. Through safety impact tests, this method proved to be ideal and deliver the best impact test results.
